Preface

The career opportunities for aestheticians have increased dramatically over the last decade with the introduction of advanced therapeutics in skin care. Dermatologists, Plastic Surgeons, Internists, Ophthalmologists, Dentists and other medical practitioners are adding non-invasive and minimally invasive therapies to their menu of services. Aestheticians are now adding deep chemical peels, microdermabrasion, lasers and intense pulse light therapies to their armamentarium of aesthetics tools.

Although the decision as to which services aestheticians perform in practices and medical spas is ultimately up to the discretion of the physician or medical director, all aestheticians desiring to enter this exciting and challenging field will benefit from the knowledge base acquired upon completion of these learning materials.

As an aesthetician, you are now crossing the line from treating clients to treating patients. All the components of esthetic care play an even more important role when designing a post-procedure treatment plan for the patient who just underwent a deep chemical peel for acne scarring, or the Rosacea patient who just completed her first intense pulse light treatment. It's important to remember that you are the skin care expert in your recommendations of skin care products and regimens to your clients. However, you are also a critical adjunct to the physician who has planned an aggressive therapy treatment for his or her patient.

With your patient-based focal point in mind, let us begin to understand and embrace the advancements in aesthetic medicine.
